

Model uncertainty and monetary policy at the Riksbank

Lars E.O. Svensson
Sveriges Riksbank

Bank of Korea Conference, May 2008

1

Flexible inflation targeting

- Stabilize inflation around the inflation target (2%/yr)
- Stabilize resource utilization
- Loss function

- Period loss function ($\lambda > 0$)

$$L_t = (\pi_t - \pi^*)^2 + \lambda(y_t - \bar{y}_t)^2$$

- Intertemporal loss function

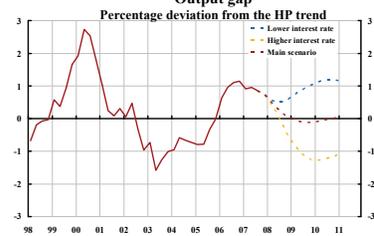

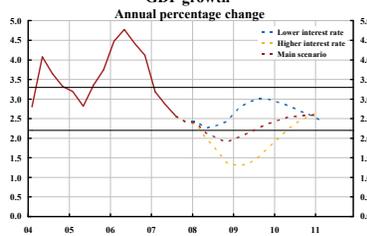

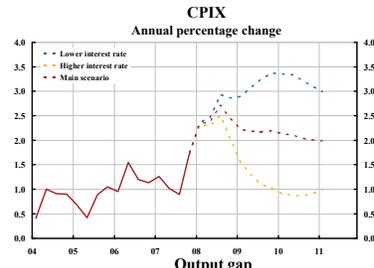

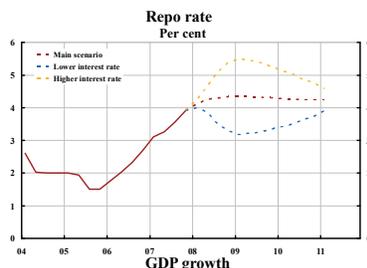

$$E_t \sum_{\tau=0}^{\infty} (1-\delta)\delta^\tau L_{t+\tau}$$

2

Flexible inflation targeting

- “Forecast targeting:” Choose the interest-rate path so that the resulting forecast for inflation and resource utilization “looks good”
- “Looks good:” Inflation approximately at 2% and resource utilization at normal 2-3 years ahead, or inflation approaching target and resource utilization approaching normal level at appropriate pace
- Riksbank: “Well-balanced” monetary policy
- “Optimal” monetary policy

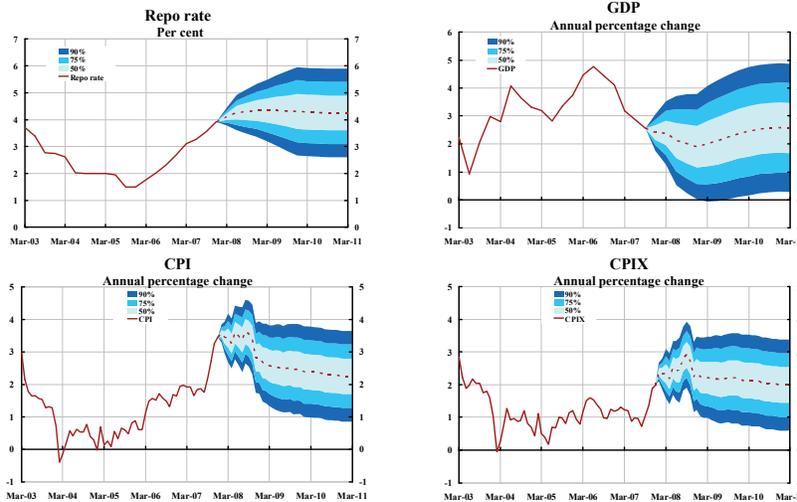

Alternative interest-rate paths and forecasts, February 2008

Forecasts are uncertain

- Probability distribution
 - Mean
 - Uncertainty interval
- Depends on available information
- Revised when new information is received
- "Forecast, not a promise!"

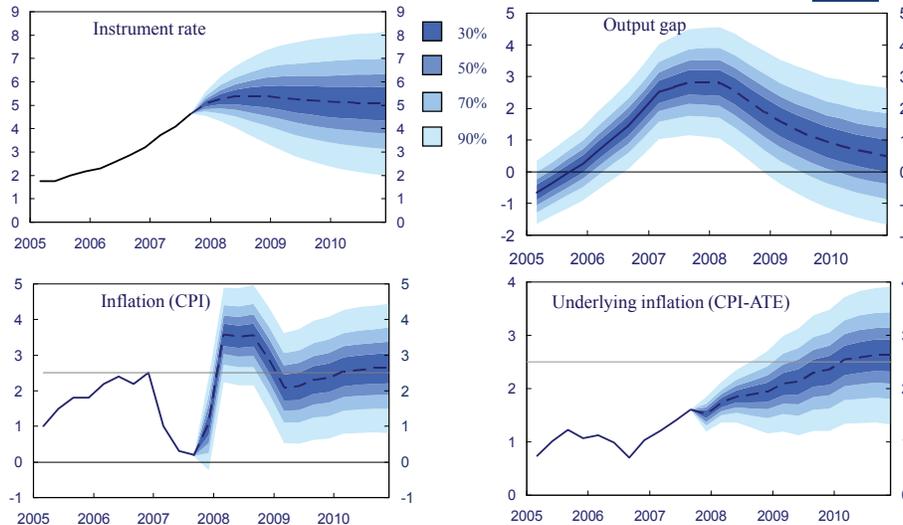

Mean value with uncertainty interval, February 2008

Baseline scenario, Norges Bank, January 2008

Per cent, 2005:1 – 2010:4

Sources: Statistics Norway and Norges Bank 7

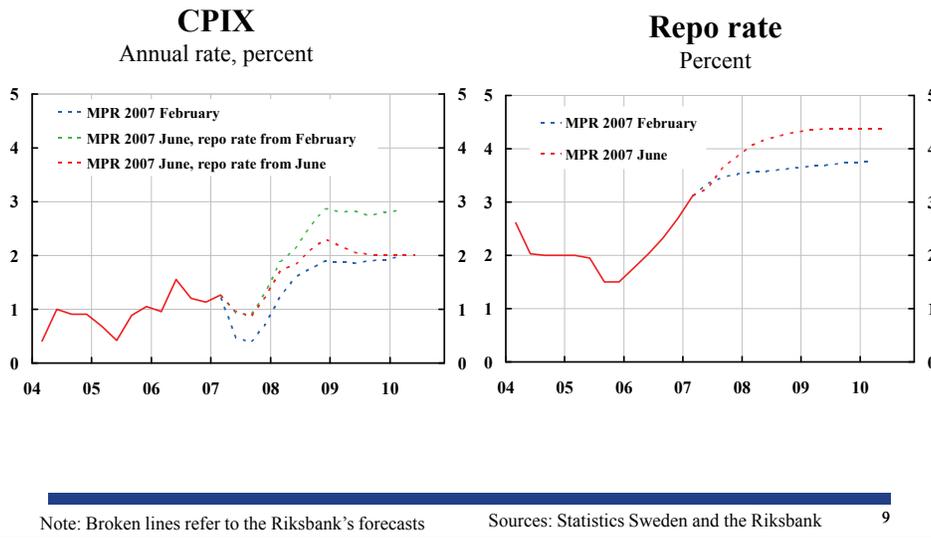

Forecast targeting: Handling new information

- New information relevant only if it changes the forecast for inflation or resource utilization *for an unchanged interest-rate path*
- “Filter new information through the forecast”
- New info shifts forecasts for inflation and resource utilization up (down) with unchanged interest-rate path
- Shift interest-rate path up (down)

8

Forecast targeting: Handling new information

Handling uncertainty

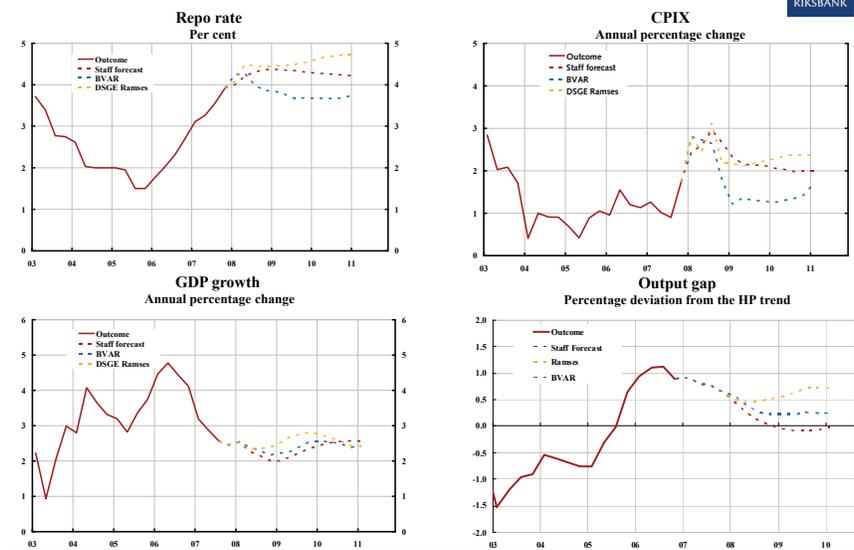

- Forecasts are mean forecasts, not mode
 - “Risk-adjusted”
 - Consistent with certainty equivalence: Known LQ model, additive uncertainty
 - Uncertainty intervals: Mainly to emphasize forecast uncertainty, do not affect policy
 - “Forecasts, not promises/commitments” (instrument-rate path)

Handling *model* uncertainty

- *Informal* model averaging: Combination of forecasts from several models (DSGE model, Bayesian VAR, indicator models)
- Various judgmental adjustments (determination of inflation expectations, non-rational expectations)

Model and staff forecasts, Feb 2008

Handling *model* uncertainty

- *Informal* considerations in individual Board member motivations
 - Names in Board minutes
- Simulations for given instrument rule (including optimal instrument rule) with parameter and shock uncertainty to construct mean forecast and uncertainty intervals
